1. From segmentation to personalization

Segmentation helps refine the picture from a mass of data to meaningful subgroups of data points.

Why not go down to extreme segmentation: segments the size of an individual?

- Major websites do it (Amazon, Yahoo!, Netflix, etc.)
- Ads providers do it (Facebook)
- News feed do it (Prismatic, Pulse)

Advantages: pinpoint accuracy and relevance Inconvenient: operational complexity

This figure shows a screenshot of an old version of the Amazon.com homepage. The page is heavily personalized, featuring a user's name (Chris) at the top right, a shopping cart icon, and a wish list link. A large green arrow points from the top right towards the top center, highlighting the 'Hello, Chris Your Account' area. Another green arrow points from the bottom left towards the middle left, highlighting the 'New For You' section. A third green arrow points from the middle left towards the bottom left, highlighting the 'more items to Consider' section. The page also features several promotional banners for Kindle devices, Valentine's Day gifts, and streaming video services. The main content area displays a grid of product thumbnails, including books like 'SEO 2013 & Beyond' and 'Brad Taylor: Enemy of Mine', and various electronic devices like GPS watches. The overall layout is cluttered with promotional content and user-specific information.

Figure 1. How is an Amazon page (old version!) personalized

2. Beyond behavior: tracking individual bodies

- Internet of Things
 - Quantified Self
 - Wearable tech
 - Smart cities
 - State surveillance ?
- More sensors, more data
created by or connected to individuals

Figure 2. The relation between connected objects and personalization

A list of bodily aspects being measured with examples:

3. The case of Nicholas Felton: constant data monitoring

a. The Feltron reports

Figure 4. Nicholas Felton

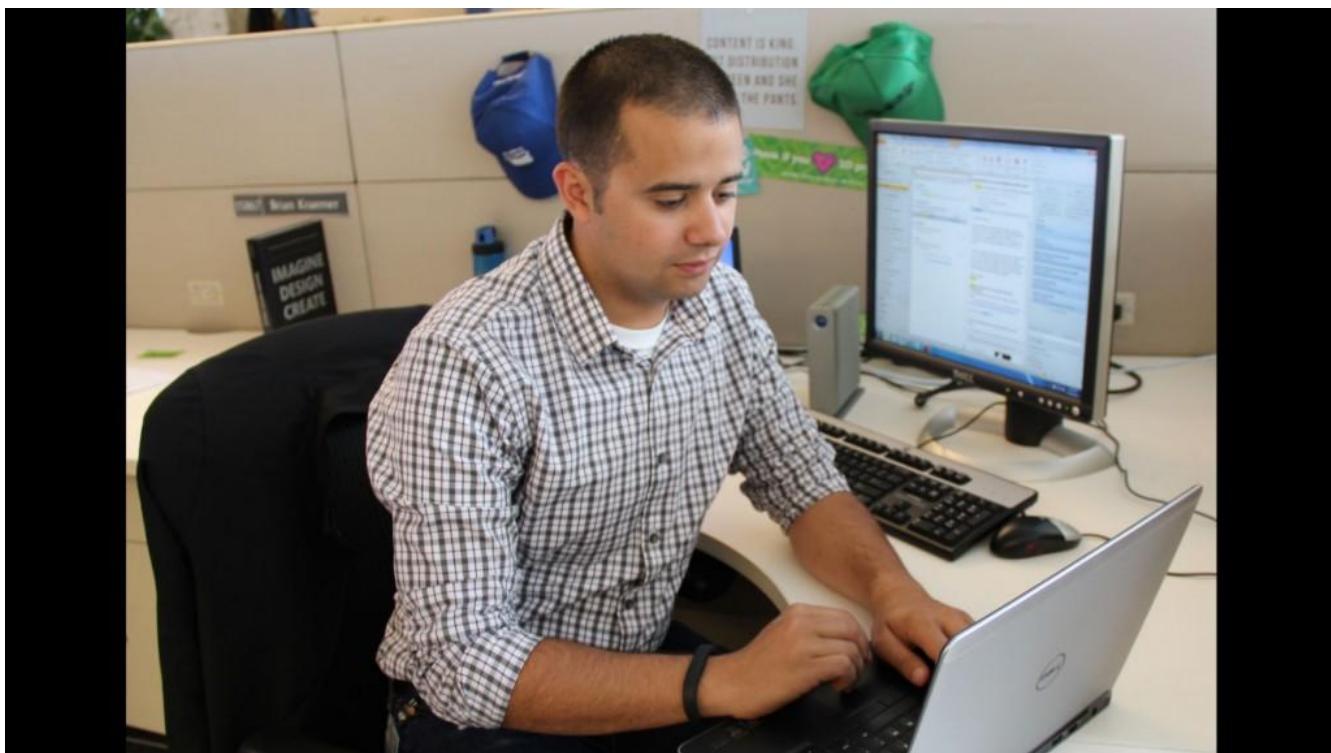

Nicholas Felton is a designer and data artist who produced printed annual reports from 2005 to 2014.

These reports synthesize his bodily data and social life, which he measures *constantly* during the year. This practice (pushed to the extreme in this case) belongs to the [quantified self](#) movement.

b. Not just Feltron

Insurance companies are interested in boosting individual health, using connected objects as monitoring devices

Companies are looking to provide a 360 degree solution to health and well being through constant monitoring:

Monitoring on health is also a B2B market to achieve "corporate welfare". See [Nokia's brochure on the topic of health services](#).

4. Issues, limits

These technologies open a vast number of issues: from data privacy to the redefinition of well-being, and the grey boundary between monitoring and surveillance. A full session of this series is devoted to discussing these issues.

For the moment, let us just repeat cautionary remarks already mentioned in a different session:

a. "personalization" has been blamed for reinforcing "bubbles" or "tribes" views of the world

(paying version of the paper, free version [here](#)).

Content personalization is also blamed for favoring political polarization via an "echo chamber effect": social media tend to show me content I already agree with (paying version of the paper [here](#), free version [here](#)).

b. Personalizing the customer relationship, even when effective, is not inherently a good thing.

It has been shown that the [Coca-Cola #ShareaCoke campaign](#) is effective at making more children choose a soda with a label to their name, over a healthy drink (paying version of the study [here](#),

free version not available).

c. Does personalization always need technology?

Companies rated with the customer service do personalization differently: with humans.

See how Zappos offers a great service to their customers:

[| https://img.youtube.com/vi/vApoQPISmvs/maxresdefault.jpg](https://img.youtube.com/vi/vApoQPISmvs/maxresdefault.jpg)

(another impactful version here)

or see (in French) how [Trainline makes its customers happy](#).

The end
